XC9103/XC9104/XC9105 Series

ETR04004-010d

Ceramic Capacitor Compatible, Step-up DC/DC Controllers

☆Green Operation Compatible

■GENERAL DESCRIPTION

The XC9103/XC9104/XC9105 series are PWM, PWM/PFM auto switching /manual switching controlled universal step-up DC/DC converter controllers.

Output will be stable no matter which load capacitors are used but should a low ESR capacitor be used, R$_{SENSE}$ of about 0.1Ω will be required and phase compensation will be achieved. This allows the use of ceramic capacitors and enables to obtain lower output ripple and small PCB design. Tantalum and electrolytic capacitors can also be used, in which case, R$_{SENSE}$ becomes unnecessary.

With 0.9V internal voltage reference and by using externally connected two resistors, output voltage can be set freely within a range of 1.5V to 30V. The series is available in 300kHz and 180kHz frequencies, the size of the external components can be reduced. 100kHz and 500kHz are also available in custom options.

The XC9103 offers PWM operation. The XC9104 offers PWM/PFM automatic switching operation. The PWM operation is shifted to the PFM operation automatically at light load so that it maintains high efficiency over a wide range of load currents. The XC9105 offers both PWM and PWM/PFM auto switching operations and it can be selected by external signal.

■APPLICATIONS

● E-book Readers / Electronic dictionaries
● Smart phones / Mobile phones
● Note PCs / Tablet PCs
● Digital audio equipments
● Multi-function power supplies

■FEATURES

|	
Input Voltage Range	: 0.9V ~ 10V
Supply Voltage Range	: 1.8V ~ 10V
Output Voltage Range	: 1.5V ~ 30V
	Set freely with the reference voltage 0.9V(±2.0%) and two resistors
Oscillation Frequency	: 100kHz, 180kHz, 300kHz, 500kHz (±15%)
Output Current	: more than 400mA (V$_{IN}$=1.8V, V$_{OUT}$=3.3V)
Controls	: PWM (XC9103)
	PWM/PFM auto-switching (XC9104)
	PWM/PFM manual switching (XC9105)
High Efficiency	: 85% (TYP.)
Stand-by Current	: I$_{STB}$=1.0µA (MAX.)
Load Capacitors	: Low ESR capacitors compatible
Packages	: SOT-25, USP-6B
Environmentally Friendly	: EU RoHS Compliant, Pb Free

■TYPICAL APPLICATION CIRCUIT

■TYPICAL PERFORMANCE CHARACTERISTICS

XC9105D093MR
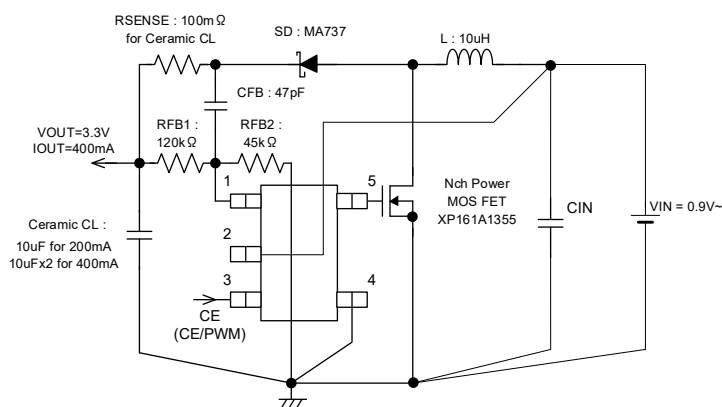

■PIN CONFIGURATION
SOT-25

(TOP VIEW)
USP-6B
(BOTTOM VIEW)

The dissipation pad for the USP-6B package should be solder-plated in recommended mount pattern and metal masking so as to enhance mounting strength and heat release.
If the pad needs to be connected to other pins, it should be connected to the V_{DD} (No.2) pin.

■PIN ASSIGNMENT

PIN NUMBER		PIN NAME	FUNCTION
SOT-25	USP-6B		
1	6	FB	Output Resistor Connection
2	2	V_{DD}	Supply Voltage
3	4	CE	Chip Enable
		CE (/PWM)	Serves as both PWM/PFM switching pin and CE pin for XC9105
4	3	GND	Ground
5	1	EXT	External Transistor Connection
-	5	NC	No Connection

■FUNCTION CHART

XC9103/XC9104 Series

CE PIN	STATUS
H	Operation
L	Shut-Down

XC9105 Series

CE/PWM PIN		STATUS
H	More than V_{DD}-0.2V	Operation (PWM control)
M	0.65 ~ V_{DD}-1.0V	Operation (PWM/PFM automatic switching control)
L	0 ~ 0.2V	Shut-Down

■ PRODUCT CLASSIFICATION

## ●Ordering Information

XC9103①②③④⑤⑥-⑦[*1]: PWM Control
XC9104①②③④⑤⑥-⑦[*1]: PWM/PFM Automatic Switching Control
XC9105①②③④⑤⑥-⑦[*1]: PWM/PFM Manual Switching Control

DESIGNATOR	ITEM	SYMBOL	DESCRIPTION
①	Type of DC/DC Controller	D	Without current limiter
②③	Output Voltage	09	FB voltage (e.g. FB Voltage=0.9V→②=0, ③=9)
④	Oscillation Frequency	3	300kHz
		1	100kHz
		2	180kHz
		5	500kHz
⑤⑥-⑦	Packages (Oder Unit)	MR-G	SOT-25 (3,000pcs/Reel)
		DR-G	USP-6B (3,000pcs/Reel)

[*1] The "-G" suffix denotes Halogen and Antimony free as well as being fully EU RoHS compliant.

Storage Temperature		Tstg	-55 ~ 125	℃

[*1] The power dissipation figure shown is PCB mounted and is for reference only.
Please refer to PACKAGING INFORMATION for the mounting condition.

■ELECTRICAL CHARACTERISTICS

XC9103D091, XC9104D091, XC9105D091   (f_{OSC}=100kHz)   Ta=25℃

PARAMETER	SYMBOL	CONDITIONS	MIN.	TYP.	MAX.	UNITS	CIRCUIT
Output Voltage	V_{OUT}		3.234	3.300	3.366	V	①
Output Voltage Range	V_{OUTSET}	V_{IN}=V_{OUTSET}x0.6, V_{DD}=3.3V IOUT=10mA, Using 2SD1628	1.5	-	30.0	V	②
FB Control Voltage	V_{FB}		0.882	0.900	0.918	V	④
Supply Voltage Range (*1)	V_{DD}		1.8	-	10.0	V	
Operation Start Voltage	V_{ST1}	Recommended circuit using 2SD1628, I_{OUT}=1.0mA	-	-	0.9	V	③
Oscillation Start Voltage (*1)	V_{ST2}	No external components, CE connected to VDD, Voltage applied, FB=0V	-	-	0.8	V	④
Operation Hold Voltage	V_{HLD}	Recommended circuit using 2SD1628, I_{OUT}=1.0mA	-	-	0.7	V	③
Supply Current 1	I_{DD1}	Same as V_{ST2}, VDD=3.3V	-	29	41	μA	④
Supply Current 2	I_{DD2}	Same as I_{DD1}, FB=1.2V	-	14	19	μA	④
Stand-by Current	I_{STB}	Same as I_{DD1}, CE=0V	-	-	1.0	μA	⑤
Oscillation Frequency	f_{OSC}	Same as I_{DD1}	85	100	115	kHz	④
Maximum Duty Cycle	MAXDTY	Same as I_{DD1}	75	81	87	%	④
PFM Duty Rate	PFMDTY	No load (XC9104D, XC9105D)	20	28	36	%	①
Efficiency	EFFI	Recommended circuit using XP161A1355	-	85	-	%	①
Soft-Start Time	t_{SS}		5.0	10.0	20.0	ms	①
CE "H" Voltage (*2)	V_{CEH}	Same as I_{DD1}	0.65	-	-	V	⑤
CE "L" Voltage (*2)	V_{CEL}	Same as I_{DD1}	-	-	0.20	V	⑤
PWM "H" Voltage (*2)	V_{PWMH}	IOUT=1.0mA (XC9105D)	V_{DD}-0.2	-		V	①
PWM "L" Voltage (*2)	V_{PWML}	IOUT=1.0mA (XC9105D)	-	-	V_{DD}-1.0	V	①
EXT "H" On Resistance	R_{EXTH}	Same as I_{DD1}, VEXT=VOUT-0.4V	-	24	36	Ω	④
EXT "L" On Resistance	R_{EXTL}	Same as I_{DD2}, VEXT=0.4V	-	16	24	Ω	④
CE "H" Current	I_{CEH}	Same as I_{DD2}, CE=VDD	-	-	0.1	μA	⑤
CE "L" Current	I_{CEL}	Same as I_{DD2}, CE=0V	-	-	-0.1	μA	⑤
FB "H" Current	I_{FBH}	Same as I_{DD2}, FB=VDD	-	-	0.1	μA	⑤
FB "L" Current	I_{FBL}	Same as I_{DD2}, FB=1V	-	-	-0.1	μA	⑤

Test Conditions: Unless otherwise stated, C_L: ceramic, recommended MOSFET should be connected.
            V_{OUT}=3.3V, V_{IN}=2.0V, I_{OUT}=170mA

NOTE:
*1 Although the IC starts step-up operations from a VDD of 0.8V, the output voltage and oscillation frequency are stabilized at VDD≧1.8V. Therefore, a VDD of more than 1.8V is recommended when VDD is supplied from VIN or other power sources.

*2 With the XC9105 series, the CE pin also serves as a PWM/PFM switching pin. In operation, PWM control is selected when the voltage at the CE pin is more than VDD -0.2V. On the other hand, PWM/PFM automatic switching control at a duty = 25% is selected when the voltage at the CE pin is less than VDD -1.0V and more than VCEH.

Test Conditions: Unless otherwise stated, C_L: ceramic, recommended MOSFET should be connected.
　　　　　V_{OUT}=3.3V, V_{IN}=2.0V, I_{OUT}=170mA

NOTE:
 *1 Although the IC starts step-up operations from a V_{DD} of 0.8V, the output voltage and oscillation frequency are stabilized at V_{DD}≧1.8V. Therefore, a V_{DD} of more than 1.8V is recommended when V_{DD} is supplied from V_{IN} or other power sources.

 *2 With the XC9105 series, the CE pin also serves as a PWM/PFM switching pin. In operation, PWM control is selected when the voltage at the CE pin is more than V_{DD} -0.2V. On the other hand, PWM/PFM automatic switching control at a duty = 25% is selected when the voltage at the CE pin is less than V_{DD} -1.0V and more than V_{CEH}.

■ TYPICAL APPLICATION CIRCUIT
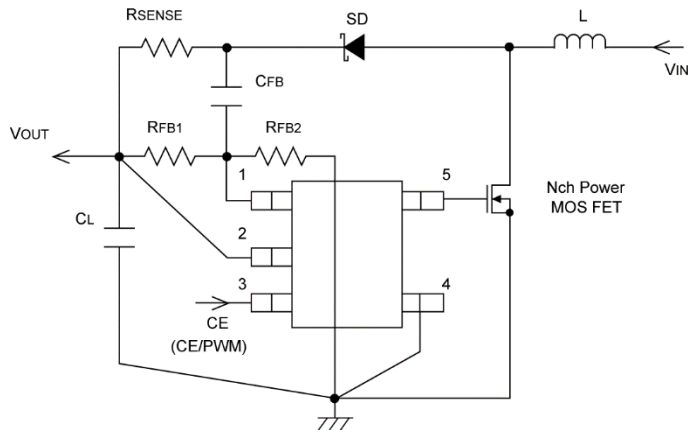

When obtaining V_{DD} from a source other than V_{OUT}, please insert a capacitor C_{DD} between the V_{DD} pin and the GND pin in order to provide stable operations.

Please place C_L and C_{DD} as close as to the V_{OUT} and V_{DD} pins respectively and also close to the GND pin. Strengthen the wiring sufficiently. RSENSE should be removed and shorted when the C_L capacitor except for ceramic or low ESR capacitor is used.
Insert R_B and C_B when using a bipolar NPN Transistor.

■ NOTES ON USE

<XC9105 CE/PWM PIN>
S_{CE}	S_{PWM}	CONDITIONS
ON	—	Chip Disable
OFF	ON	Duty=25%, PWM/PFM automatic switching
OFF	OFF	PWM

By using external signals, the control of the XC9105 series can be alternated between PWM control and PWM/PFM automatic switching control. By inputting a voltage of more than V_{DD} -0.2V to the CE/PWM pin, PWM control can be selected. On the other hand, PWM/PFM automatic switching control can be selected by inputting a voltage of less than V_{DD} - 1.0V.

With the XC9105, by connecting resistors of the same value (R_{M1}, R_{M2}) as shown in the diagram to the left, it is possible to obtain chip disable with S_{CE} ON and, S_{PWM} ON or OFF, PWM/PFM auto switching at Duty=25% with S_{CE} OFF & S_{PWM} ON, & PFM control with both switches OFF.

Note:
When operating at V_{DD} -1.8V and below (stepping-up from VIN=0.9V), it is necessary to pull-up to V_{DD} in order to allow the CE/PWM pin reach the V_{CEH} voltage level. Please make sure that the IC is in PWM control (S_{PWM}=OFF) when operations start. If S_{PWM} is ON, there are times when chip enable might not operate.

* Please select your external components carefully.

■ OPERATIONAL EXPLANATION

The XC9103/04/05 series are step-up DC/DC converter controller ICs with built-in high speed, low ON resistance drivers.

<Error Amp.>
Error amplifier is designed to monitor the output voltage, comparing the feedback voltage (FB) with the reference voltage Vref. In response to feedback of a voltage lower than the reference voltage Vref, the output voltage of the error amp. decreases.

<OSC Generator>
This circuit generates the internal reference clock.

<Ramp Wave Generator>
The ramp wave generator generates a saw-tooth waveform based on outputs from the OSC Generator.

<PWM Comparator>
The PWM comparator compares outputs from the error amp. and saw-tooth waveform.   When the voltage from the Error Amp's output is low, the external switch will be set to ON.

<PWM/PFM Controller>
This circuit generates PFM pulses.
The PWM/PFM automatic switching mode switches between PWM and PFM automatically depending on the load.   The PWM/PFM automatic switching mode is selected when the voltage of the CE pin is less than V_{DD} - 1.0V, and the control switches between PWM and PFM automatically depending on the load. PWM/PFM control turns into PFM control when threshold voltage becomes lower than voltage of error amps. PWM control mode is selected when the voltage of the CE pin is more than V_{DD} - 0.2V. Noise is easily reduced with PWM control since the switching frequency is fixed. The series is suitable for noise sensitive portable audio equipment as PWM control can suppress noise during operation and PWM/PFM switching control can reduce consumption current during light load in stand-by.

<Vref 1 with Soft Start>
The reference voltage, Vref (FB pin voltage)=0.9V, is adjusted and fixed by laser trimming (for output voltage settings, please refer to the notes on next page). To protect against inrush current, when the power is switched on, and also to protect against voltage overshoot, soft-start time is set internally to 10ms. It should be noted, however, that this circuit does not protect the load capacitor (C_L) from inrush current. With the Vref voltage limited and depending upon the input to the error amps, the operation maintains a balance between the two inputs of the error amps and controls the EXT pin's ON time so that it doesn't increase more than is necessary.

<Enable Function>
This function controls the operation and shutdown of the IC. When the voltage of the CE pin is 0.2V or less, the mode will be disable, the channel's operations will stop and the EXT1 pin will be kept at a low level (the external N-type MOSFET will be OFF). When the IC is in a state of disable, current consumption will be no more than 1.0 μA.
When the CE pin's voltage is 0.65V or more, the mode will be enabled and operations will recommence.

■ OPERATIONAL EXPLANATION (Continued)

① Output Voltage Setting

Output voltage can be set by adding external split resistors. Output voltage is determined by the following equation, based on the values of R_{FB1} and R_{FB2}. The sum of R_{FB1} and R_{FB2} should normally be 2MΩ or less.

$$V_{OUT} = 0.9 \times (R_{FB1} + R_{FB2}) / R_{FB2}$$

The value of C_{FB}, speed-up capacitor for phase compensation, should result in fzfb = $1/(2\pi \times C_{FB} \times R_{FB1})$ equal to 5 to 30kHz. Adjustments are required depending on the application, value of inductance (L), and value of load capacity (C_L).

fzfb = 30kHz (L=10μH)	[Example of Equation]
fzfb = 20kHz (L=22μH)	R_{FB1} : 120kΩ R_{FB2} : 45kΩ
fzfb = 10kHz (L=47μH)	C_{FB} : 47pF (fzfb = 30kHz, L = 10μH)
	68pF (fzfb = 20kHz, L = 22μH)
	130pF (fzfb = 10kHz, L = 47μH)

② The use of ceramic capacitor C_L

The circuit of the XC9103/04/05 series is organized by a specialized circuit, which reenacts negative feedback of both voltage and current. Also by insertion of approximately 100mΩ of a low and inexpensive sense resistor as current sense, a high degree of stability is possible even using a ceramic capacitor, a condition which used to be difficult to achieve. Compared to a tantalum condenser, because the series can be operated in a very small capacity, it is suited to use of the ceramic capacitor, which is cheap and small.

③ External Components

Tr   :*When a MOSFET is used:
            XP161A1355PR (N-ch Power MOSFET, TOREX)
            Note*: As the breakdown voltage of XP161A1355 is 8V, take care with
                    the power supply voltage.
                    With output voltages over 6V, use the XP161A1265 with a
                    breakdown voltage of 12V.
            VST1: XP161A1355PR =1.2V (MAX.)
                    XP161A1265PR = 1.5V (MAX.)
SD   :MA2Q737 (Schottky type, Panasonic)
L,C_L :When Using Ceramic Type

*When a NPN Tr. Is used:

2SD1628 (ON Semiconductor)

R_B : 500Ω (Adjust with Tr's HFE or load)

C_B : 2200pF (Ceramic type set so that R_B and pole is less than 70% of f_{OSC})

$C_B \leq 1 / (2\pi \times R_B \times f_{OSC} \times 0.7)$

Ceramic Type

L   :22μH (CDRH5D28, SUMIDA, f_{OSC} = 100, 180kHz)
            10μH (CDRH5D18, SUMIDA, f_{OSC} = 300, 500kHz)
C_L :10V 10μF (Ceramic Type, LMK325BJ106ML, TAIYO YUDEN)
            Use the formula below when step-up ratio and output current is large.
            C_L = (C_L standard value) x (I_{OUT}(mA) / 300mA x V_{OUT} / V_{IN})
R_{SENSE} :100mΩ (f_{OSC} = 180, 300, 500kHz)
            50mΩ (f_{OSC} = 100kHz)

Tantalum Type

L   :22μH (CDRH5D28, SUMIDA, f_{OSC} = 300kHz)
            47μH (CDRH5D28, SUMIDA, f_{OSC} = 100, 180kHz)
            Except when I_{OUT}(mA) / 100mA x V_{OUT} / V_{IN} > 2 → 22μH
            10μH (CDRH5D18, SUMIDA, f_{OSC} = 500kHz)
C_L :16V, 47μF (Tantalum Type 16MCE476MD2, NICHICHEMI)
            Use the formula below when step-up ratio and output current is large.
            C_L = (C_L standard value) x (I_{OUT}(mA) / 300mA x V_{OUT} / V_{IN})
R_{SENSE} :Not required, but short out the wire.

AL Electrolytic Type

L   :22μH (CDRH5D28 SUMIDA, f_{OSC} = 300kHz)
            47μH (CDRH5D28 SUMIDA, f_{OSC} = 100, 180kHz)
            Except when I_{OUT}(mA) / 100mA x V_{OUT} / V_{IN} > 2 → 22μH
C_L :16V, 100μF (AL Electrolytic Type) + 10V, 2.2μF (Ceramic Type)
            Strengthen appropriately when step-up ratio and output current is
            large.
R_{SENSE} :Not required, but short out the wire.

④ For temporary, transitional voltage drop or voltage rising phenomenon, the IC is liable to malfunction should the ratings be exceeded.

⑤ Torex places an importance on improving our products and their reliability. We request that users incorporate fail-safe designs and post-aging protection treatment when using Torex products in their systems.
